Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

BBS Lett. 334, 238-236, 1993
Fitle: Cloning and expression in yeast of a higher plant chorismate mutase. Molecular
Reference number: S38958; MUID:940,3841; PMID:8224252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pathway: aromatic amino acid biosynthesis
Superfamily: chorismate mutase of the ArcQ class, eukaryotic type
Keywords: aromatic amino acid biosynthesis; chloroplast; intramolecular transferase;
11-60/Pomain: transit peptide (chloroplast) #status predicted <TNP>
61-334/Product: chorismate mutase #status predicted <MAT>
                                                                                                      A,Title: Cloning and expression in yeast of a higher plant chorismate mutase..MA, Title: Cloning and expression in yeast of a higher plant chorismate mutase..MA, Reference number: S38958; MUID:94039841; PMID:8224252
A,Accession: S38958
A,Molecule type: mRNA
A,Residues: 1-334 <EBE>
A,Cross-references: EMBL:226519; NID:9429152; PIDN:CAA81286.1; PID:9429153
C,Genetics:
C,Genetics: A,Genome: nuclear
C,Function:
A,Description: intramolecular transferase; isomerase
A,Bethway: arcmatic amino acid biosynthesis
C,Superfamily: chorismate mutase of the AroQ class, eukaryotic type
C,Keywords: aromatic amino acid biosynthesis; chloroplast; intramolecular trans
F;1-60/Domain: transit peptide (chloroplast) #status predicted <TNP>

probable membrane protein YFR041c - yeast (Saccharomyces cerevisiae)
N;Alternate names: hypothetical protein F018
N;Alternate names: hypothetical protein F018
C;Species: Saccharomyces cerevisiae
C;Date: 02-Sep-1995 #sequence revision 19-Oct-1995 #text_change 23-Sep-2002
C;Accession: 856296; 862252; 863788
R;Murakami, Y; Naitou, M.; Hagiwara, H.; Shibata, T.; Ozawa, M.; Sasanuma, S.I.; Sasanum A;Description: Analysis of the nucleotide sequence of chromosome VI from Saccaromyces cen A;Reference number: 856186
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A; Molecule type: DNA

CATALYTIC ACTIVITY: 2'-deoxyribonucleoside diphosphate + oxidized thioredoxin + H(2)O = ribonucleoside diphosphate + reduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       similarity).
SIMILARITY: Belongs to the ribonucleoside diphosphate reductase
large chain family.
                                                                                                                                                       01-NOV-1995 (Rel. 32, Last sequence update)

Trangencive genome evolution in Buchnera aphidicola.";
Proc. Natl. Acad. Sci. U.S.A. 100:581-586(2003).
-: FUNCTION: Catalyzes the biosynthesis of deoxyribonucleotides from
the corresponding ribonucleotides, precursors that are necessary
for DNA synthesis (By similarity).
-: GATALYTIC ACTIVITY: 2' deoxyribonucleoside diphosphate + oxidized
thioredoxin + H(2)O = ribonucleoside diphosphate + reduced
                                                                                                                                                                                                        SGNYYTLASVREDLVRQEDTIIYGLIERAKFPSNSHTYDEKYAQIQGFCGSLVEFVVRNT

```

Robertson G.T., Kovach M.E., Allen C., Ficht T.A., Roop R.M. II;
Submitted (JAN-1998) to the EMBL/Genbank/DDBJ databases.
-!-FUNCTION: Degrades short-lived regulatory and abnormal proteins in
presence of ATP. Hydrolyzes two ATPs for each peptide bond cleaved
in the protein substrate (By similarity).
-!-CATALYTIC ACTIVITY: Hydrolysis of large proteins such as globin,
casein and denaturated serum albumin, in presence of ATP.
-!-SUBUNIT: Homotetramer (By similarity).

Bacteria; Proteobacteria; Alphaproteobacteria; Rhizobiales; Brucellaceae; Brucella.

Brucella abortus.

bipolar spindles.
-!-SUBCELULAR LOCATION: Spindle pole body and the microtubule organizing center (MTOC).
-!-SIMILARITY: Belongs to the GCP family.
-!-CAUTION: Ref.1 sequence differs from that shown due to a frameshift in position 1.

-!-SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!-SIMILARITY: Belongs to the clpX chaperone family. HslV subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDIATE-2012; PubMed=10683204;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description

The invention discloses isolated polymucleotides encoding chorismate mutase polypeptides. Aromatic amino acids must be included in the diets of animals. In the aromatic amino acids must be included in the diets of animals. In the aromatic amino acid biosynthatic pathway chorismate is converted to anthranilate during tryptophan biosynthesis and is converted to prephenate, the branch point for trynssine and phenylalanine to biosynthesis. Chorismate mutase catalyses the conversion of chorismate to prephenate. Also disclosed are methods for selecting an isolated polymelic enzyme polypeptide in a host cell, obtaining a nucleic acid is polymucleotide that affects the level of expression of a tyrosine polypeptide and regardating compounds for their ability to inhibit the activity of a tyrosine biosynthetic enzyme. The polypeptides can be used good attibodies. Chorismate mutase and prephenate dehydrogenase are good trynsles enzymes may be used to increase the content of aromatic amino of these enzymes may be used to increase the content of aromatic amino of these enzymes may be used to increase the content of aromatic amino of inhibitors of those enzymes that may be used as herbicides. The content cand physical mapping of the genes and as markers for traits mutase on the service of the genetic and physical mapping of the genes and as markers for traits mutase on the content cands and as markers for the mates of the content cands and as markers for the mates of the content cands and as markers for the cands of the content cands and as markers for the cands of the content cands and as markers for the cands of the content cands and as markers for the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the cands of the c
                                                                                                                                                                                                        New tyrosine biosynthetic enzyme, chorismate dismutase, proteins and nucleic acids; useful for facilitating design and/or identifying inhibitors of those enzymes that may be used as herbicides and for producing antibodies.
                                                                                                                                                                                                                                                                                                                                                                                          Claim 3; Page 22; 32pp; English.

E E E	Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
X S. X	Claim 144; SEQ ID NO 972; 577pp + Sequence Listing; English.
<b>188</b>	The invention relates to identifying a stress condition to which a plant
888	representative of expressed polymorlectides in array or probes representative of the plant cel
888	detecting a profile of expressed polynuclectides in the plant cell characteristic of a stress response. The method is useful in the characteristic of a stress response.
כר	production of transgenic plants, cells and seed

```
with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       360

This invention describes a novel method for the preparation of fine chemicals by culturing organisms in which the shikimate pathway has been altered relative to the wild type. The method involves a construct containing a plastid transit peptide, a chorismate mutase and/or prephenate dehydrogenase, linked to at least one regulatory sequence for transcription or translation in plants. The method is used to produce chemicals, particularly Vitamins B or K and/or ubiquinone, useful e.g. as fat-soluble antioxidants (in feeds, pharmaceuticals and cosmetics), but also aromatic amino acids, salicylic or folic acid derivatives, phenylpropanoids, flavanoids etc., especially in transgenic plants. Also plants with increased Vitamin B contents have improved resistance to abiotic stress, e.g. frost and drought. Transgenic plants with an altered abiotic stress, e.g. frost and drought. Transgenic plants with an altered chicking processed foodstuffs. Transgenic plants with modified shikimate pathways have increased content of desired chemicals, particularly tocopherols and/or tocotrienols. This sequence encodes the construct pCR-Script/AtCM-ITP-ATCM-2 which is composed of the Arabidopsis thaliana plastid chorismate mutase-1 transit peptide and a Arabidopsis thaliana chorismate mutase-1 transit peptide and a Arabidopsis thaliana chorismate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Preparing fine chemicals, particularly Vitamins E and K, useful as anticxidants e.g. in foods or medicine, by growing organisms with altered shikimate biosynthesis pathway.
                                                                                                                                                                       Shikimate pathway, chorismate mutase, gene, prephenate dehydrogenase, vitamin E, vitamin K, ubiquinone, fat-soluble antioxidant, transgenic, teed, pharmaceutical, cosmetic; aromatic amino acid, salicylic acid, folic acid, phenylpropancid, flavancid, plant, abictic stress resistance, tocopherol, tocotrienol, ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    210 G; 297 T; 0 U; 0 Other;

This invention describes a novel method for the preparation of fine chemicals by culturing organisms in which the shikimate pathway has been altered relative to the wild type. The method involves a construct containing a plastid transit peptide, a chorismate mutase and/or translation or translation in plants. The method is used to produce translation or translation in plants. The method is used to produce chemicals, particularly Vitamins E or K and/or ubiquinone, useful e.g. as aromatic anino acide, salicylic or folic acid derivatives, pherypropanoids, flavanoids etc., especially in transganic plants. Also plants with increased Vitamin E contents have improved resistance to blants with increased Vitamin E contents have improved resistance to blants with increased Vitamin E contents have improved resistance to blants with increased foodstuffs. Transgenic plants with an altered shikimate pathway are useful as foods, fodder and in preparation of processed foodstuffs. Transgenic plants with modified shikimate pathways and/or tocotrienols. This sequence encodes the Arabidopsis thallana and/or tocotrienols. This sequence encodes the Arabidopsis thallana cytosolic chorismate mutase-2 protein used in the method of the invention
                                                                                                                                                                                                                                           Preparing fine chemicals, particularly Vitamins E and K, useful as antioxidants e.g. in foods or medicine, by growing organisms with altered shikimate biosynthesis pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              184 GCTAAGTTTCCACTCAATTCTCCTGCTTTCGAGGAATCTCGTTGTTGTAGATTCTGGAAGT 243

The present sequence is that of an antisense oligonucleotide that is specific for Arabidopsis thaliana chorismate-mutase-2 (CM) mRNA. CM catalyyses the conversion of chorismate to prephenate in a branch of the shikimate pathway leading to phenylalanine and tyrosine biosynthesis. It is essential for plant growth, inhibition of CM gene expression in plant seedlings results in severe chlorosis, reduced growth and developmental abnormalities. The invention provides compositions for the modulation of plant growth or development using CM antisense and sense polynucleotides, double-stranded RNA and ribozymes, and related expression cassettes and vectors. The compositions are particularly useful for the modulation and inhibition of plant growth, and for generating male sterile plants or plants that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              IleHisTyrGlyLysPheValAlaGluValLysPheArgAspAlaProGlnAspTyrGlu 178
and development, by using chorismate synthase and chorismate mutase as targets which are essential for plant growth.
